CAE Fast Publish

Video Cloud

API Developer

Add Videos/Assets, Dynamic Delivery, Dynamic Ingest API, Ingest Profiles API

Context Aware Encoding (CAE) yields great renditions, but it can take a long time to analyze the source video. If getting new videos online as quickly as possible is a high priority for you, the fast publish option described in this document allows you to publish videos quickly while still taking advantage of CAE.

Introduction

Fast publish allows you to use CAE (/context-aware-encoding-beta) and still get videos online as quickly as possible by creating one or more temporary renditions which can be played immediately. The following conditions then apply:

- As soon as dynamic renditions are available, they will be used rather than the temporary rendition(s) for playback
- At some point after all the dynamic renditions have been processed, the static rendition(s) will be deleted automatically

Note that Context Aware Encoding is in beta. If you are interested in participating in the beta, please contact your Account Manager.

Requirements

In order to use fast publish, you must:

1. Have an account enabled for Dynamic Delivery (/overview-dynamic-ingest-api-dynamic-delivery)
2. Have the account enabled for CAE (/context-aware-encoding-beta)
3. Create a custom CAE ingest profile using the Ingest Profiles API (/ingest-profiles-api) (instructions below)

Custom profile for fast publish

Creating a custom profile enabled for fast publish is straightforward. It looks like a regular CAE profile, with one difference: in addition to a `renditions` array, the `dynamic_origin` object will contain a `temporary_renditions` array containing one or more fast publish renditions.

The fast publish renditions are specified by name and **must** come from the list below (the number following **video** is the target bitrate for the rendition):

- default/video900
- default/video700
- default/video6000
- default/video450
- default/video4000
- default/video3800
- default/video3500
- default/video2500
- default/video2000
- default/video1700
- default/video1200

Since the point of fast publish is to make a rendition available for playback as quickly as possible, it probably makes sense to use a low to mid-range bitrate for at least one of the temporary renditions.

Steps for creating a custom profile

Here are the steps for creating a custom fast publish profile with one temporary rendition. In the steps below, we will use the `multi-platform-standard-dynamic` (/overview-digital-rights-management-drm-video-cloud#multi-platform-standard-dynamic) standard profile as the basis for the custom profile, but you can use any of the **CAE** profiles.

i You can create as many custom profiles as you like using the procedure below, but we recommend only creating as many as your really need to avoid confusion and user errors.

Get client credentials for the Ingest Profiles API

- 1 Login to Studio and go to the API Authentication section (<https://studio.brightcove.com/products/videocloud/admin/oauthsettings>) under Admin (you must be an Admin or get an Admin on the account to do this)
- 2 Click **Register New Application** to create a new set of client credentials.
- 3 Select the appropriate account(s) and *at least* these permissions for the credentials:

Ingestion Profiles	Players
<input type="checkbox"/> Configuration Read	<input type="checkbox"/> Read
<input type="checkbox"/> Configuration Read/Write	<input type="checkbox"/> Read/Write
<input checked="" type="checkbox"/> Read	
<input checked="" type="checkbox"/> Read/Write	

Figure 1: Ingestion Profiles Permissions

- 4 Save the **Client ID** and **Client Secret** as you will need them for later steps.

Create the JSON for the custom profile

- 5 Copy the JSON below (for the **multi-platform-standard-dynamic** profile) into a text editor:

```

1  {
2      "name": "multi-platform-standard-dynamic",
3      "display_name": "Multiplatform Standard (CAE)",
4      "description": "Deliver a wide range of content types across a variety of platforms on mobile and desk
5      "account_id": null,
6      "digital_master": {
7          "rendition": "passthrough",
8          "distribute": false
9      },
10     "renditions": [],
11     "packages": [],
12     "dynamic_origin": {
13         "renditions": [
14             "default/audio64",
15             "default/audio128",
16             "default/audio96"
17         ],
18         "images": [
19             {
20                 "label": "thumbnail",
21                 "height": 90,
22                 "width": 160
23             },
24             {
25                 "label": "poster",
26                 "height": 720,
27                 "width": 1280
28             }
29         ],
30         "dynamic_profile_options": {
31             "min_renditions": 2,
32             "max_renditions": 6,
33             "min_resolution": {
34                 "width": 320,
35                 "height": 180
36             },
37             "max_resolution": {
38                 "width": 1280,
39                 "height": 720
40             },
41             "max_frame_rate": 30,
42             "max_bitrate": 2400,
43             "max_first_rendition_bitrate": 250,
44             "keyframe_rate": 0.5,
45             "select_baseline_profile_configuration": true
46         }
47     }
48 }

```

- 6** Change the following values:
- name: "multi-platform-standard-dynamic-fast-publish"
 - display_name: "Fast Publish Standard (CAE)"
 - account_id: "YOUR_ACCOUNT_ID"

- 7** After the dynamic_origin>renditions array, add the following array:

```

    "temporary_renditions": [
        "default/video450",
        "default/video700",
        "default/video900"
    ]

```

- 8** The full JSON for your custom profile should now look like this:

```

{
  "name": "multi-platform-standard-dynamic-fast-publish",
  "display_name": "Fast Publish Standard (CAE)",
  "description": "Deliver a wide range of content types across a variety of platforms on mobile and desktop.",
  "account_id": "account_id",
  "digital_master": {
    "rendition": "passthrough",
    "distribute": false
  },
  "renditions": [],
  "packages": [],
  "dynamic_origin": {
    "renditions": [
      "default/audio64",
      "default/audio128",
      "default/audio96"
    ],
    "temporary_renditions": [
      "default/video450",
      "default/video700",
      "default/video900"
    ],
    "images": [
      {
        "label": "thumbnail",
        "height": 90,
        "width": 160
      },
      {
        "label": "poster",
        "height": 720,
        "width": 1280
      }
    ],
    "dynamic_profile_options": {
      "min_renditions": 2,
      "max_renditions": 6,
      "min_resolution": {
        "width": 320,
        "height": 180
      },
      "max_resolution": {
        "width": 1280,
        "height": 720
      },
      "max_frame_rate": 30,
      "max_bitrate": 2400,
      "max_first_rendition_bitrate": 250,
      "keyframe_rate": 0.5,
      "select_baseline_profile_configuration": true
    }
  }
}

```

Add the custom profile your account

Now we will use the Ingest Profiles API to add the custom profile to your account.

i You can use whatever tool you normally do to make REST API requests - if you need help getting this set up, see our guides to using Insomnia (/use-insomnia-api-requests), Postman (/use-postman-api-requests), or cURL (/concepts-set-curl).

Getting access tokens

Each API request needs to be authenticated using an access token (you will see exactly how in later steps).

9 You will need to get an access token (/getting-access-tokens) from:

```
https://oauth.brightcove.com/v4/access_token
```

- 10** If you are using Insomnia (/use-insomnia-api-requests) or Postman (/use-postman-api-requests), then you can set up OAuth2 authentication using the instructions in the linked documents to have them fetch the access tokens for you.
- 11** If you are using cURL, here is a cURL command you can use to get an access token - you will need to replace the ENCODED_AUTHENTICATION_STRING with a Base64-encoded string consisting of your client_id:client_secret:

```
curl --request POST \  
  --url 'https://oauth.brightcove.com/v4/access_token?grant_type=client_credentials' \  
  --header 'Authorization: Basic ENCODED_AUTHENTICATION_STRING' \  
  --header 'Content-Type: application/x-www-form-urlencoded'
```

You can use this utility (/base-64-encoding-tool) to get your Base64-encoded authentication string.

- 12** Note that access tokens expire after 5 minutes - if that happens, just get a new one (Insomnia will get one for you automatically when it's needed).

Add the custom ingest profile

- 13** If you are using Insomnia (/use-insomnia-api-requests) or Postman (/use-postman-api-requests), set up a new POST request to:

```
https://ingestion.api.brightcove.com/v1/accounts/account_id/profiles
```

The request body will be the JSON for the custom profile you created earlier.

Include a Content-Type: application/json header

Set up OAuth2 authentication according to the instructions in the guides to using Insomnia or Postman.

- 14** If you are using cURL, you can use the following request, replacing the account_id and access token values with your own:

```

curl --request POST \
  --url https://ingestion.api.brightcove.com/v1/accounts/account_id/profiles \
  --header 'authorization: Bearer YOUR_ACCESS_TOKEN_HERE' \
  --header 'content-type: application/json' \
  --data '{
    "name": "multi-platform-standard-dynamic-fast-publish",
    "display_name": "Fast Publish Standard (CAE)",
    "description": "Deliver a wide range of content types across a variety of platforms on mobile and desktop.",
    "account_id": "57838016001",
    "digital_master": {
      "rendition": "passthrough",
      "distribute": false
    },
    "renditions": [],
    "packages": [],
    "dynamic_origin": {
      "renditions": [
        "default/audio64",
        "default/audio128",
        "default/audio96"
      ],
      "temporary_renditions": [
        "default/video450",
        "default/video700",
        "default/video900"
      ],
      "images": [
        {
          "label": "thumbnail",
          "height": 90,
          "width": 160
        },
        {
          "label": "poster",
          "height": 720,
          "width": 1280
        }
      ],
      "dynamic_profile_options": {
        "min_renditions": 2,
        "max_renditions": 6,
        "min_resolution": {
          "width": 320,
          "height": 180
        },
        "max_resolution": {
          "width": 1280,
          "height": 720
        },
        "max_frame_rate": 30,
        "max_bitrate": 2400,
        "max_first_rendition_bitrate": 250,
        "keyframe_rate": 0.5,
        "select_baseline_profile_configuration": true
      }
    }
  }'

```

15 After you send the request, you should see your new profile echoed back to you in the response.

Notifications

When fast publish temporary renditions are created, you will receive a DYNAMIC_RENDITION "CREATE" notifications just as you do for the regular renditions:

```
{
  "entity": "contextAwareEncoding5",
  "entityType": "DYNAMIC_RENDITION",
  "version": "1",
  "action": "CREATE",
  "jobId": "413a9938-6d73-478c-b4d9-fdeb45927a4b",
  "videoId": "5600255921001",
  "dynamicRenditionId": "contextAwareEncoding5",
  "bitrate": 364,
  "width": 512,
  "height": 384,
  "accountId": "1910141566001",
  "status": "SUCCESS"
}
```

A new notification will be sent when a temporary rendition has been deleted:

```
{
  "entity": "fastpublishRendition1",
  "entityType": "DYNAMIC_RENDITION",
  "version": "1",
  "action": "DELETE",
  "jobId": "413a9938-6d73-478c-b4d9-fdeb45927a4b",
  "videoId": "5600255921001",
  "dynamicRenditionId": "fastpublishRendition1",
  "accountId": "1910141566001",
  "status": "SUCCESS"
}
```
